

How to update Server Metadata through the mobile app?

Server metadata is information that describes the characteristics and content of a server. There may be times when you need to change the metadata for your server. For example, you may need to update the server's name or install a new application. Before you start, make sure you have the necessary permissions to modify the server metadata. You will also need to have access to the server itself, either through a remote connection or by physically accessing the server.

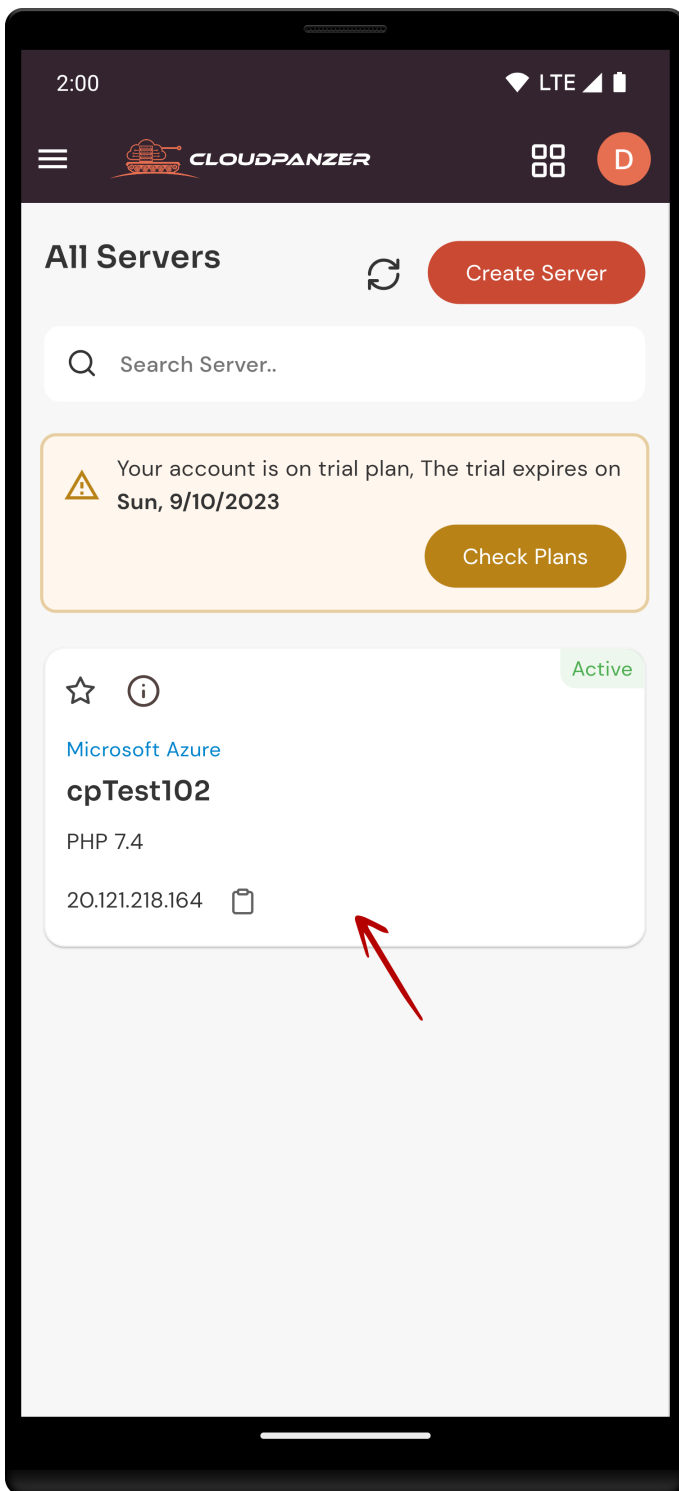

Tutorial :

You can watch the Video or Continue reading the post.
