How to use PHP Built In Extensions in Mobile App?

PHP extensions are modules that provide additional functionality to the PHP programming language. They are used to extend the core functionality of PHP by adding new features and capabilities. PHP extensions can be written in C or C++ and are typically compiled into shared libraries that can be dynamically loaded into PHP at runtime. There are numerous PHP extensions available, covering a wide range of functionalities such as database connectivity, encryption, image processing, XML parsing, networking, and more.
